LAPORAN WORKSHOP DESAIN UI (PRAKTIKUM)
GENAP 2025/2026

NAMA/NIM : ZASKIA RANIA ZAINI / 434241104
KELAS : TI - B2

LAYOUTING

A. Task Description

Create a webpage layout using CSS Grid and Flexbox to organize different sections including header, body, sidebar, and footer.

B. Task Requirement

1. **Grid Name**: Implement CSS Grid to define the layout structure. Name your grid container appropriately.
2. **Flexbox Usage**: Utilize Flexbox to arrange items within the sections for flexible and responsive design.

C. Section: Design the Webpage with The Following Sections:

1. **Header**: Contains branding/logo and navigation links.
2. **Body**: Main content area for displaying articles, posts, or other relevant information.
3. **Sidebar**: Sidebar section for additional content, links, or widgets.
4. **Footer**: Footer section with copyright information, social media links, and other relevant details.

D. Instructions

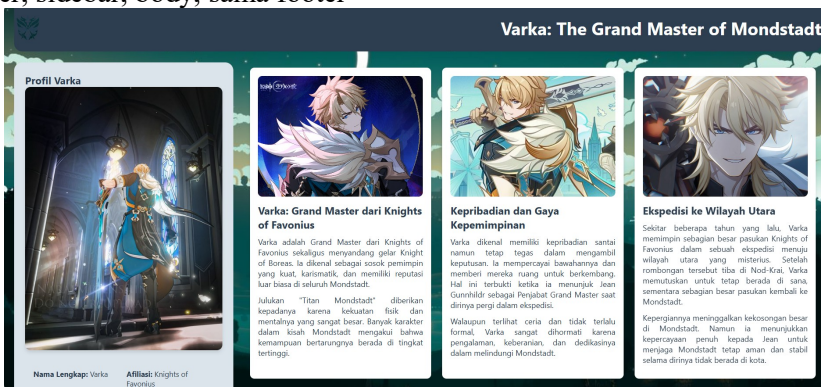
1. **Design the layout structure using CSS Grid**, defining appropriate grid areas for header, body, sidebar, and footer sections.
2. **Utilize Flexbox properties within each section** to align and arrange the content as needed.
3. **Add content**, such as text, images, or placeholders, to each section to simulate a realistic webpage layou

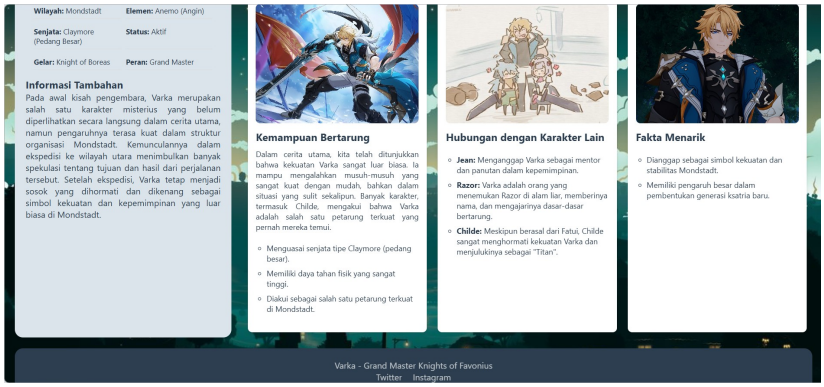
E. Hasil Pelaksanaan

Di sini sudah saya bagi jadi 4 section sesuai dengan peritah

1. Tampilan Webpage

Ada header, sidebar, body, sama footer

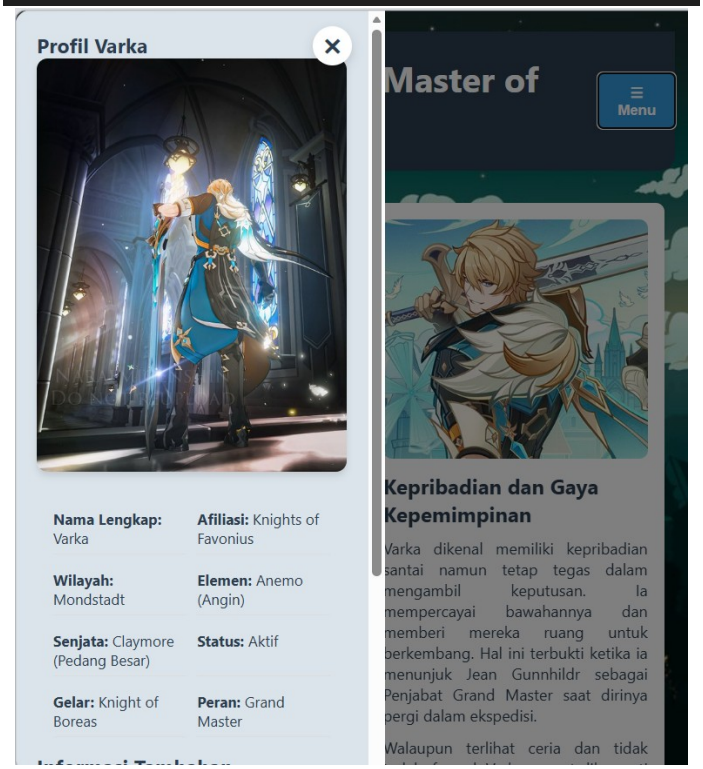




2. CSS

CSS berrisi class yang mengatur tampilan untuk layar desktop dan menyertakan media queries agar tampilan tetap fungsional di mobier. Di sini ada tambahan section sidebar (jadi sidebar bisa dibuka gitu) sama tombol hamburger yang digunakan untuk membuka sidebar. Untuk codingnya bisa diliat sendiri di file css saya.

3. JavaScript

JavaScript di sini fokus pada pengoperasian dari sidebar agar bisa dijalankan dalam tampilan mobile.


```
modul 4 > JS script.js > ...
1  document.addEventListener('DOMContentLoaded', () => {
2      // Logika Sidebar
3      const menuBtn = document.getElementById('menuBtn');
4      const closeBtn = document.getElementById('closeBtn');
5      const sidebar = document.querySelector('.sidebar-section');
6      const overlay = document.getElementById('overlay');
7      const toggleSidebar = () => {
8          sidebar.classList.toggle('active');
9          overlay.classList.toggle('active');
10     };
11     menuBtn.addEventListener('click', toggleSidebar);
12     closeBtn.addEventListener('click', toggleSidebar);
13     overlay.addEventListener('click', toggleSidebar);
14 });
```
